Maxpein: Clone?
isn't that what
make you laugh?

Deib: silly pein hahaha,
it's a clown.
Clone/cloning is a
technique scientists use
to make exact genetic
copies of living things.

Maxpein: wow! it's interesting! can you tell me more about that?

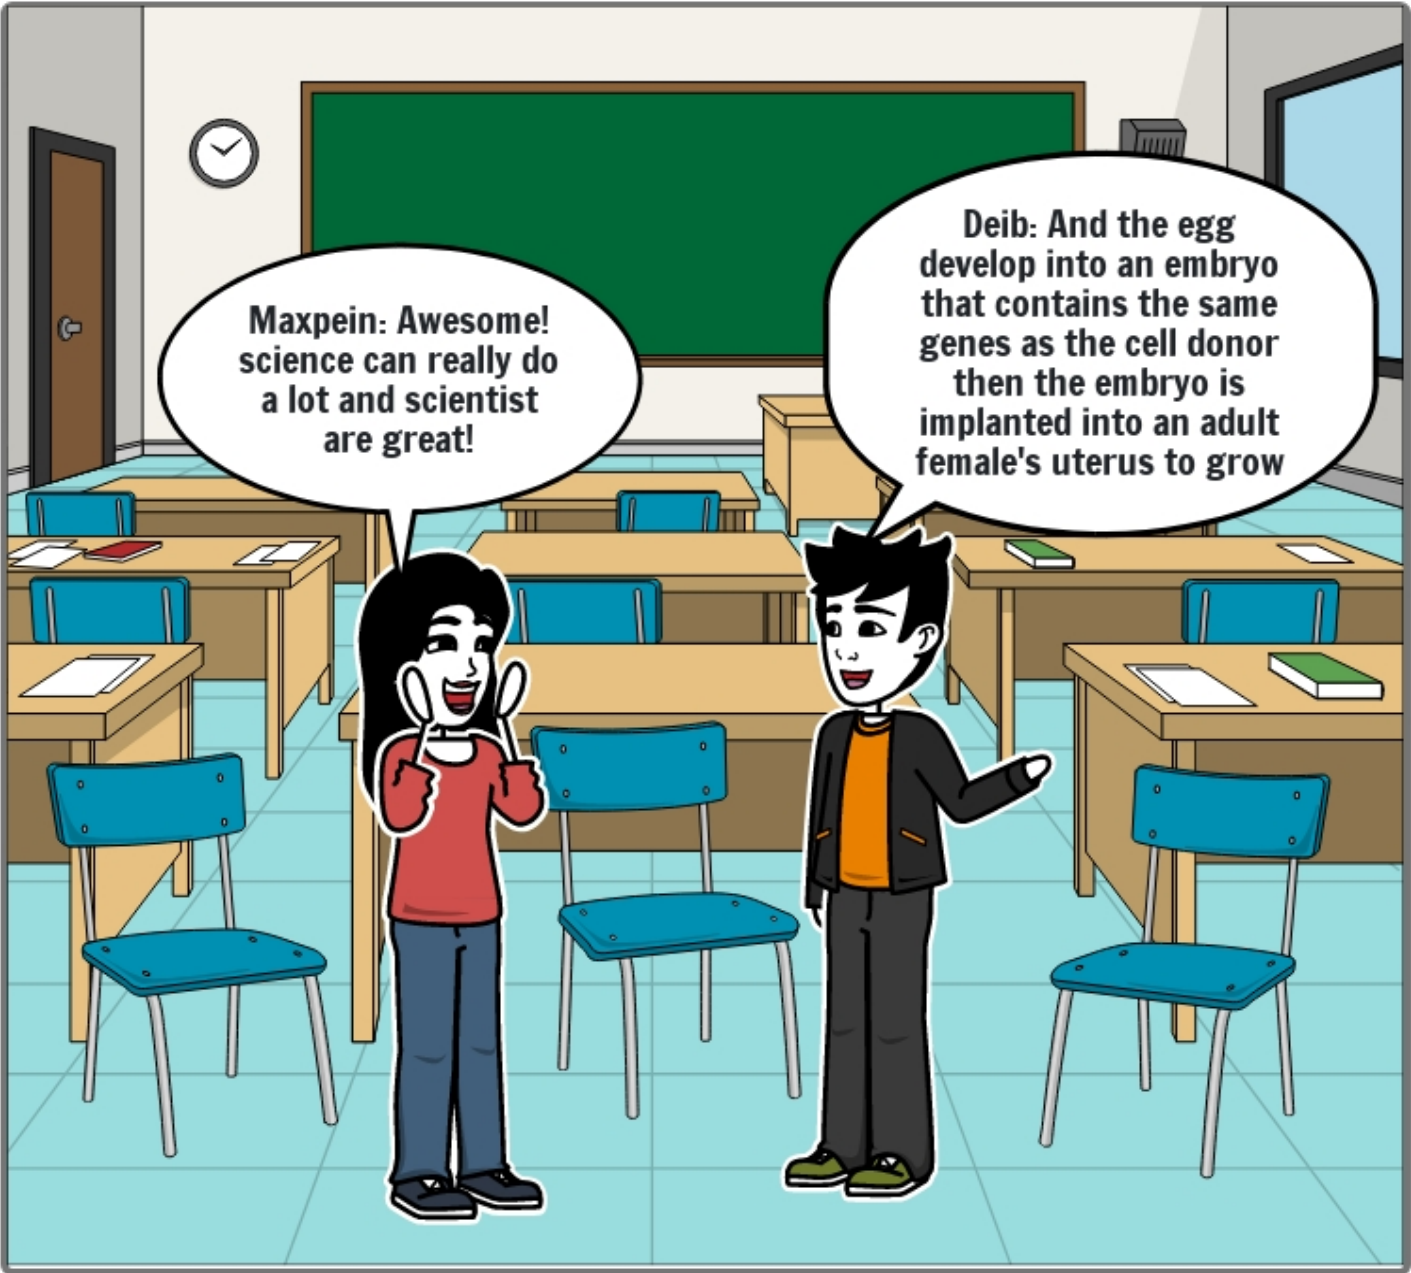

Deib: Any kind of living things can be cloned and all their organisms are identical.

Maxpein: But how? by taking a picture and copy it?

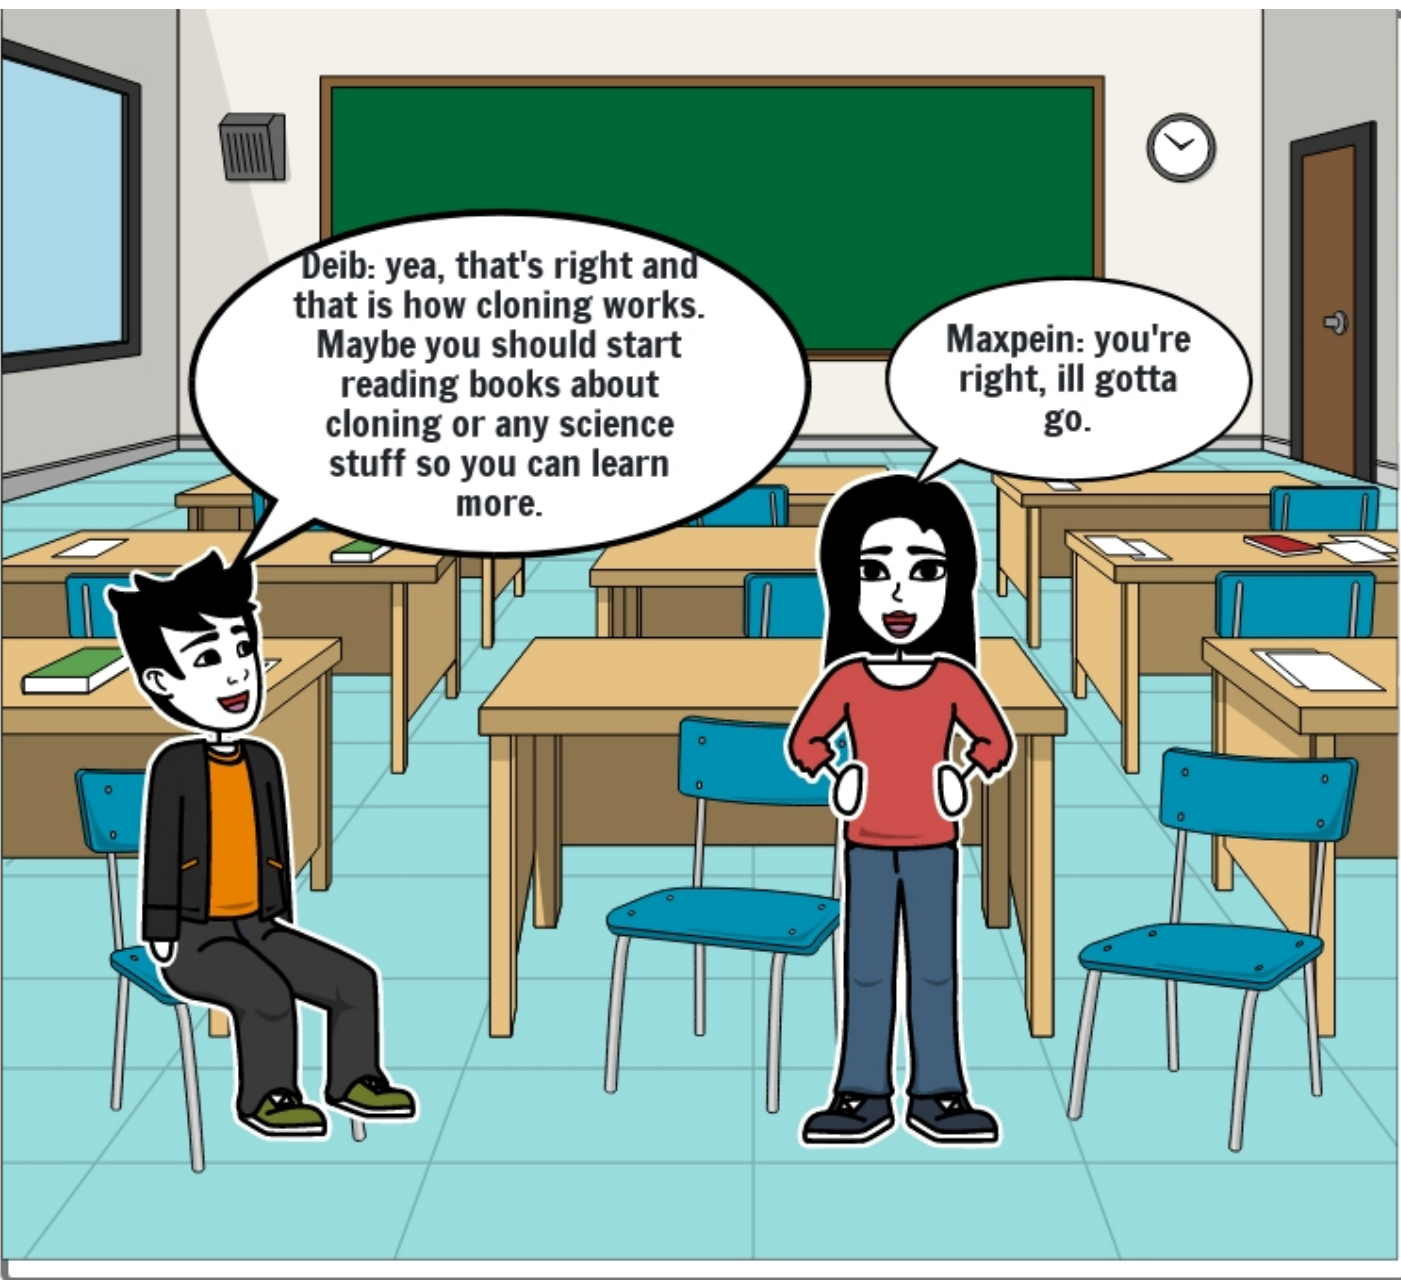

Deib: Hahahaha ofcourse not. Its by their DNA, there is a different type of cloning the one is to transfer the DNA from an animal's somatic cell into an egg cell that has its nucleus and DNA removed.

Maxpein:
Thats it?

Maxpein: Awesome!
science can really do
a lot and scientist
are great!

Deib: And the egg
develop into an embryo
that contains the same
genes as the cell donor
then the embryo is
implanted into an adult
female's uterus to grow

Deib: yea, that's right and that is how cloning works. Maybe you should start reading books about cloning or any science stuff so you can learn more.

Maxpein: you're right, ill gotta go.

Deib: where are you going?

Maxpein: To the library i'll read some books, bye!
